Background

The zinc finger MYND-type containing 11 encoded by ZMYND11 was first identified by its ability to bind the adenovirus E1A protein. The protein localizes to the nucleus. It functions as a transcriptional repressor, and expression of E1A inhibits this repression. Alternatively spliced transcript variants encoding different isoforms have been identified.

IHC: 1: 100 - 1: 300

ELISA: 1: 20000

Not yet tested in other applications.
