Background

BCLAF1encodes a transcriptional repressor that interacts with several members of the BCL2 family of proteins. Overexpression of this protein (BCL2 associated transcription factor 1) induces apoptosis, which can be suppressed by co-expression of BCL2 proteins. The protein localizes to dot-like structures throughout the nucleus, and redistributes to a zone near the nuclear envelope in cells undergoing apoptosis. Multiple transcript variants encoding different isoforms have been found for BCLAF1.
