## Background

MYB encodes a protein with three HTH DNA-binding domains that functions as a transcription regulator. This protein plays an essential role in the regulation of hematopoiesis. This gene may be aberrently expressed or rearranged or undergo translocation in leukemias and lymphomas, and is considered to be an oncogene. Alternative splicing results in multiple transcript variants.

### **Recommended Dilution**

WB: 1: 500 - 1: 2000 ELISA: 1: 20000 Not yet tested in other applications.
