Background

CTNND1 (catenin delta 1) encodes a member of the Armadillo protein family, which function in adhesion between cells and signal transduction. Multiple translation initiation codons and alternative splicing result in many different isoforms being translated. Not all of the full-length nature of the described transcript variants have been determined. Read-through transcription also exists between CTNND1 and the neighboring upstream thioredoxin-related transmembrane protein 2 (TMX2) gene.
