Background

This gene encodes a member of a family of small membrane proteins that share a 35-amino acid signature sequence domain beginning with the sequence PFXYD and containing 7 invariant and 6 highly conserved amino acids. The approved human gene nomenclature for the family is FXYD-domain containing ion transport regulator. FXYD4| originally named CHIF for channel-inducing factor| has been shown to modulate the properties of the Na|K-ATPase| as has FXYD2| also known as the gamma subunit of the Na|K-ATPase| and FXYD7. Transmembrane topology has been established for FXYD4 and two family members (FXYD1 and FXYD2)| with the N-terminus extracellular and the C-terminus on the cytoplasmic side of the membrane. Alternatively spliced transcript variants encoding the same protein have been found.
