### Background

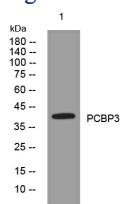

This gene encodes a member of the KH-domain protein subfamily. Proteins of this subfamily| also referred to as alpha-CPs| bind to RNA with a specificity for C-rich pyrimidine regions. Alpha-CPs play important roles in post-transcriptional activities and have different cellular distributions. This gene's protein is found in the cytoplasm| yet it lacks the nuclear localization signals found in other subfamily members. Alternative splicing results in multiple transcript variants encoding distinct isoforms.
